Selena Chik

# How I built Breaking Games' holiday dashboard

I turned six raw exports into one connected SQLite database, then built a one-page dashboard on top of it.

# Architecture

Every card, table and chart on the dashboard comes from two tables and one view.

## RAW DATA FILES

**shopify_sales**
+ product_id I added

**shopify_orders**

**shopify_checkouts**

**referrals**

**meta_campaigns**

**meta_ad_sets**
(not used)

## WHAT I BUILT

**dim_product**
**table** · reads: shopify_sales

**dim_referrer**
**table** · reads: referrals

**fact_product_performance**
**table** · reads: dim_product, shopify_sales, referrals. Used for the reorder rec, not the dashboard

**clean_checkouts**
**view** · reads: shopify_checkouts

## WHAT FEEDS THE DASHBOARD

**dashboard_metrics**
**table** · reads: shopify_sales, shopify_orders, meta_campaigns, clean_checkouts, referrals, dim_referrer

**dashboard_leaderboard**
**table** · reads: shopify_sales

**dashboard_channels**
**view** · reads: referrals, dim_referrer

## DASHBOARD

**dashboard.html**
numbers copied in by hand

# Three design decisions

Each of these fixes one problem in the raw exports.

| PROBLEM | WHAT I DID | HOW I CHECKED |
|---|---|---|
| **dim_product**<br>No shared product key across the exports. | One row per product (116) with a generated product_id, also added to shopify_sales. Sales stay in the sales table. | All 116 sales rows got a product_id; 184 of 185 named order rows match. Limit: URL slugs match only 45 of 116 product pages, none in the Dwellings line. |
| **dim_referrer**<br>470 different referrer names. | Grouped into 7 channels plus Other, including a Bot / Suspicious bucket. Paid Social (Meta) = facebook, instagram, meta, internalfb. | All 823,393 pageviews map to a channel; Other is only 0.6%. Limit: with no UTM tags, I can't tie one visit to one order. |
| **clean_checkouts**<br>Bot carts inflate abandonment. | Two rules set before counting: a line with more than 5 copies of one item, or an email with more than 5 carts. A view, so it updates itself. | 1,197 carts down to 1,162 (35 removed). Rules I tested and dropped (missing email, zero subtotal) caught 0 carts. Risk: a store buying 6 copies gets dropped. |

# One metric, three answers

Cart abandonment looked like 92.3%. Measured fairly, it's 26.4%.

## 92.3%

**First try**

All carts ever, against one month of orders.

1 − 92 orders ÷ 1,197 carts

## 29.8%

**Same month**

Carts and orders from August 2026 only.

39 carts ÷ (39 carts + 92 orders)

## 26.4%

**Bots removed**

6 bot carts from one email taken out.

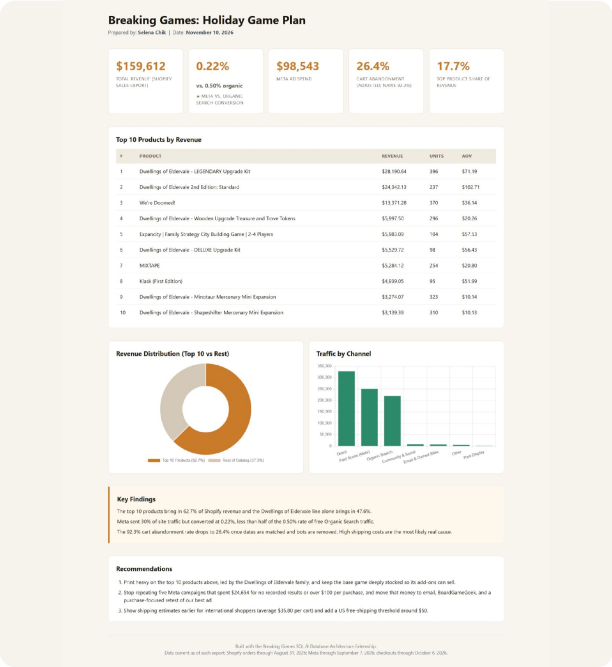

33 carts ÷ (33 carts + 92 orders)

Matching the month mattered far more than the bots: **62.5 points** vs **3.4 points**.

# The dashboard

Five numbers, a top-10 leaderboard and two charts. The ★ number is one I added: visitors from Meta, our only paid channel, reach checkout at less than half the rate of free search traffic.

Live dashboard: [paste Google Drive link]

## How 0.22% vs 0.50% is built

1. **referrals**
   Pageviews and checkout sessions for each of 470 referrers

2. **dim_referrer**
   facebook, instagram, meta, internalfb → Paid Social: 553 of 250,618. google, bing + 9 more → Organic Search: 1,093 of 219,555

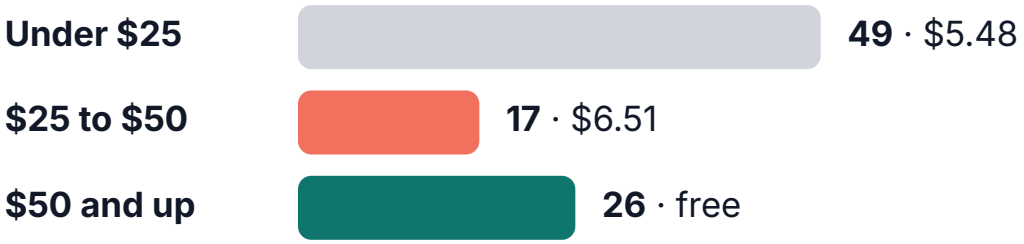

3. **dashboard_metrics**
   meta_conversion_pct = 100 × 553 ÷ 250,618 = 0.22; organic = 100 × 1,093 ÷ 219,555 = 0.50

4. **Dashboard card**
   **0.22% vs 0.50%**, placed next to the $98,543 Meta spend card

# My idea for Breaking Games

Show shoppers how close they are to free shipping, with a one-click Dwellings add-on to get them there.

## AUGUST 2026 ORDERS BY SIZE, WITH AVERAGE SHIPPING PAID

**17 of 92**

August orders fell between $25 and $50, on average $17.30 short of free shipping.

### Why it would help

Free shipping at $50 already exists: every US cart of $50 or more in 2025 and 2026 shipped free. But 66 of 92 orders (72%) fell short and paid shipping. A $7 to $10 Dwellings add-on, like the Oracle Hex Tile or a mini expansion, closes most of the gap.

### What it would take

A free-shipping progress bar in the cart (a Shopify theme setting or app) and a short list of add-ons the store already sells. Then track the share of orders at $50 or more in shopify_orders.

Source: shopify_orders (August 2026), clean_checkouts. One month of orders, so a test, not a proven result.
